

Summit Project Plan

Project Title

Expanding the Scope of Collaborative Teams

District/ Organization

School District of Waunakee

Project Description

The goal of this project is to create a process that all professional learning communities (PLC) can use to develop data driven instruction to ensure student growth. The group will focus on developing a structured system for data analysis to guide teachers in discovering areas where more instruction is needed.

Current use of PLC time is for daily curriculum planning and the development of assessments. This project will challenge departments to analyze student data to drive classroom instruction and school wide interventions.

In addition, departments throughout the district are currently using formative assessments without a clear focus of how to use the data. The proposed project will help teachers engineer more effective use of data to create necessary interventions and push towards mastery of essential standards.
